

# Servers Dashboard Design

Zhenan Hong  
UX/Product Designer

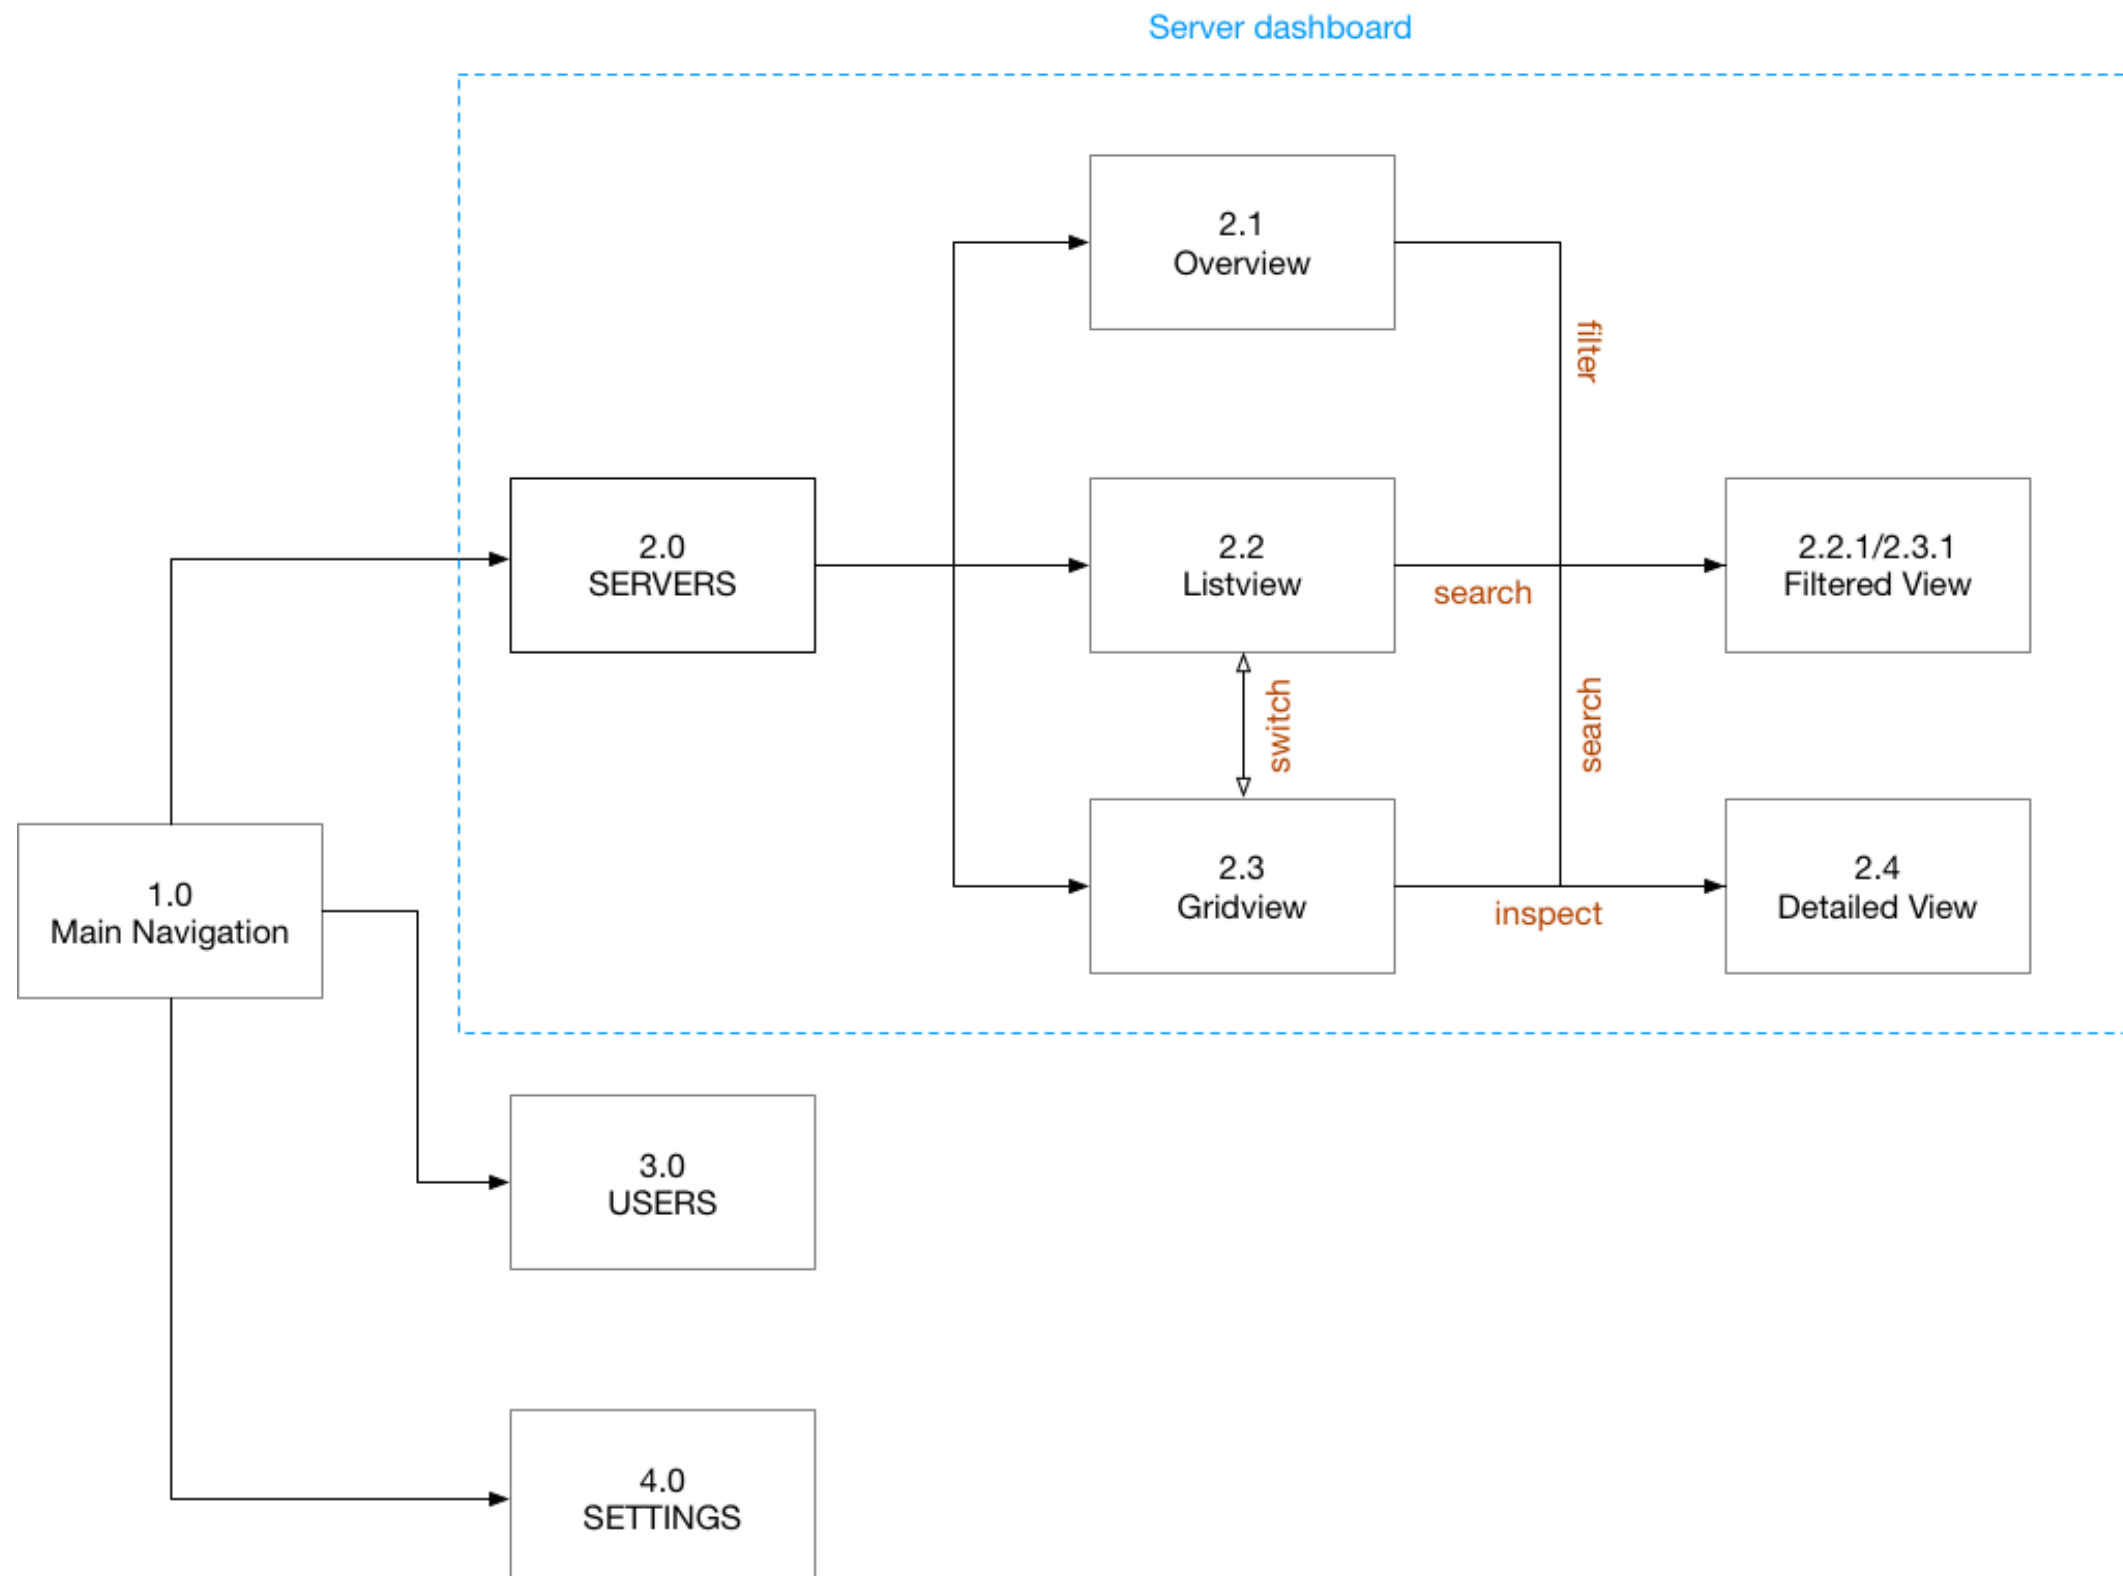

# Design Brief

Visualize status of a large inventory of servers on a web page:

Design Strategy	Needs
Overview, Listview/ Gridview, Configurable	All essential information is available at a glance
Single action/batch actions	Support basic actions on the server
Filter, Color coded, Historical Snapshot	Highlight any issues with the servers

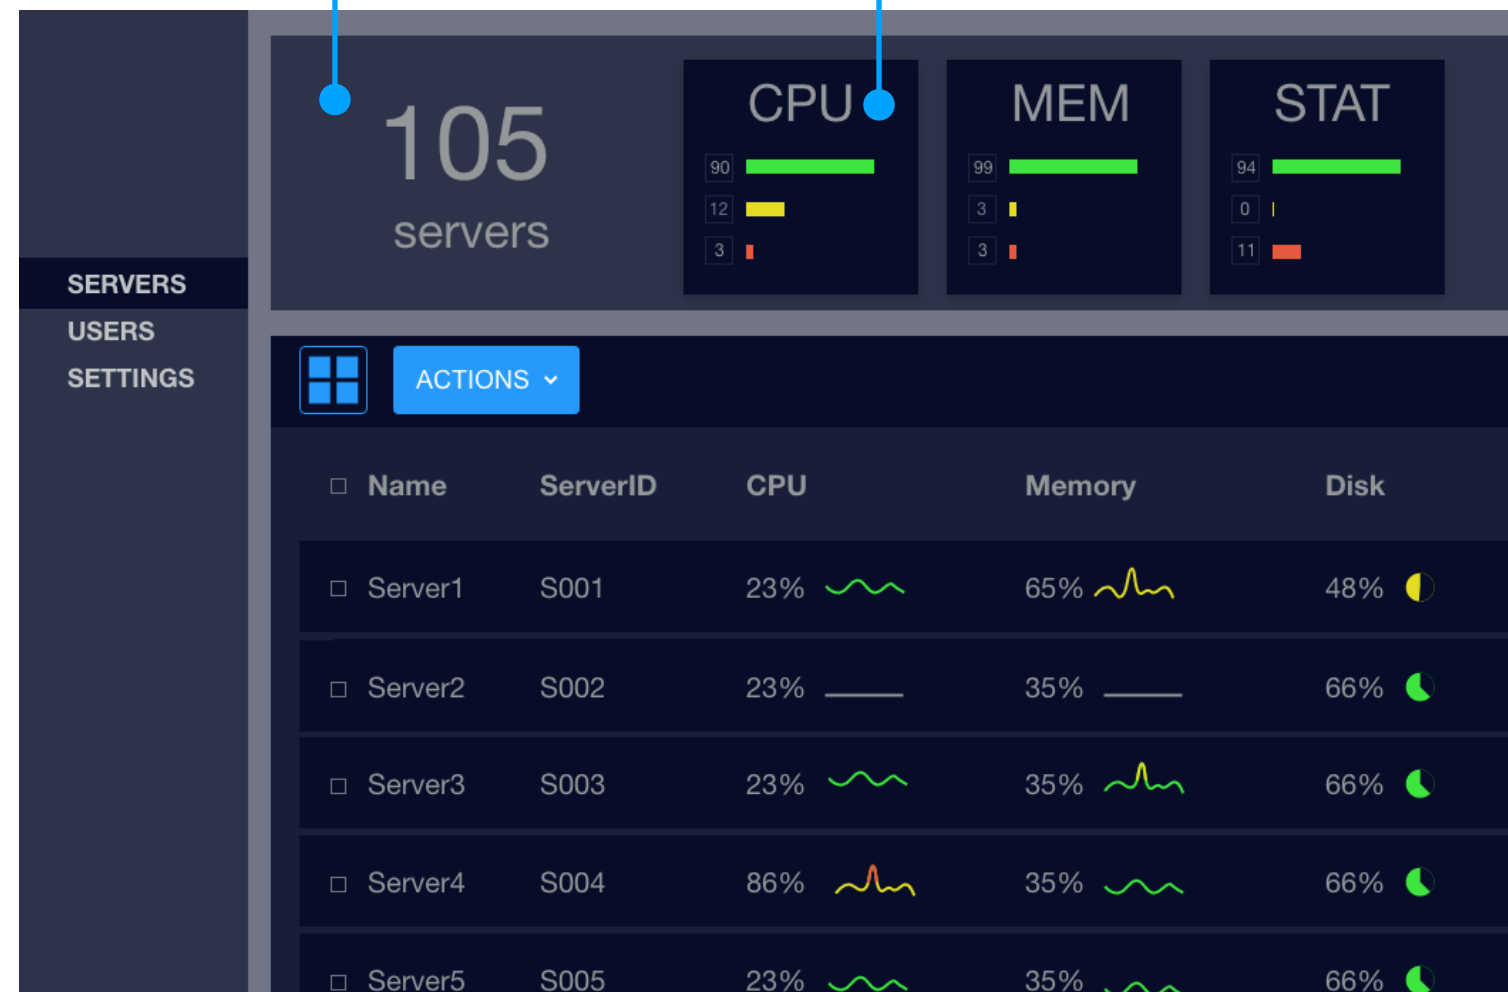

# Information Architecture: Dashboard Webapp

# All essential information is available at a glance

## Overview

Display high level overview information about all the servers. Provide aggregated count of servers on different essential aspects to understand system health.

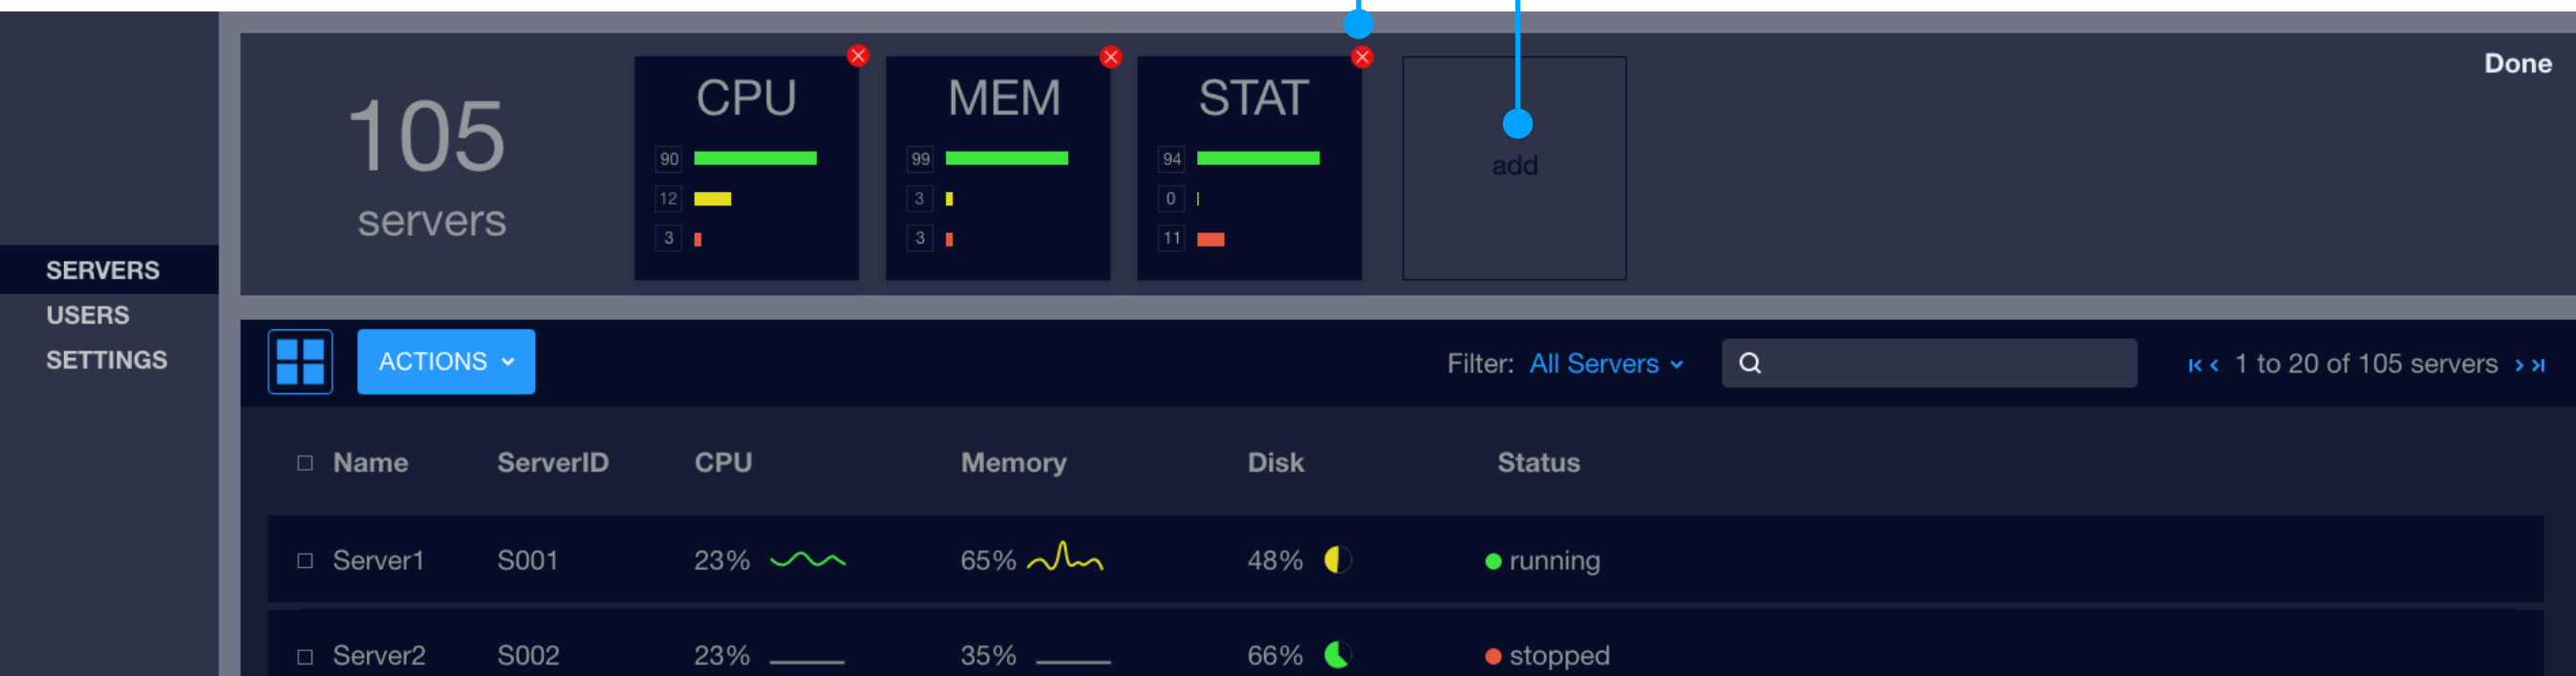

# All essential information is available at a glance

## Configurable

Provide the flexibility to define what 'essential' means to different users

Remove essential info

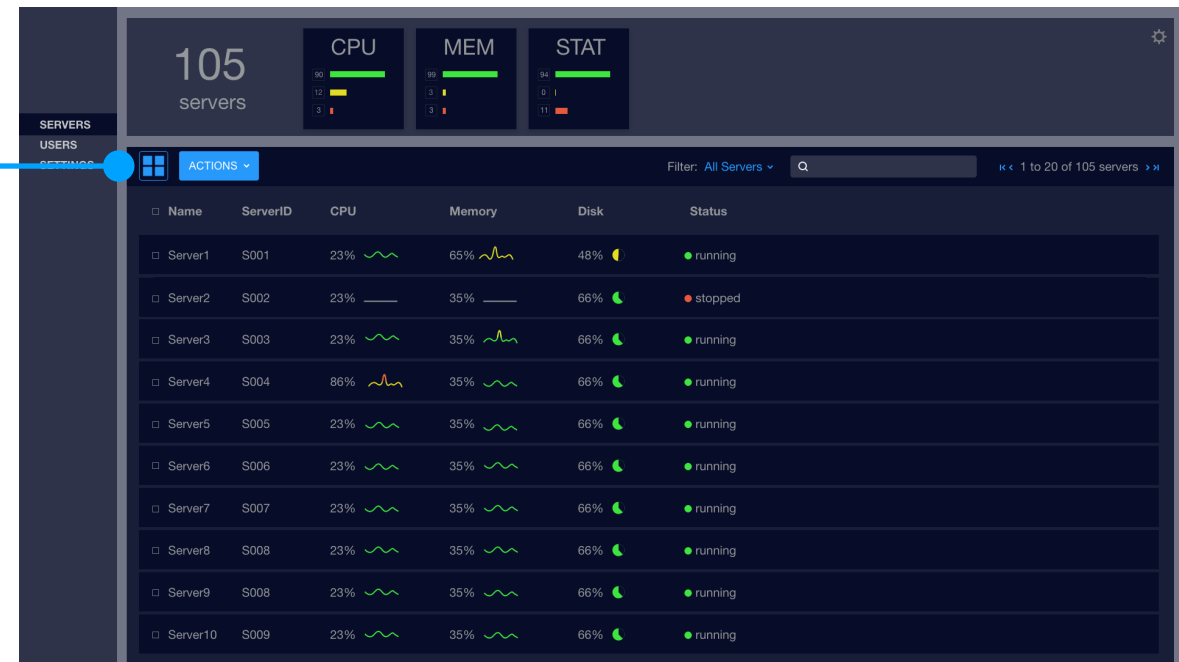

Add essential info

## All essential information is available at a glance

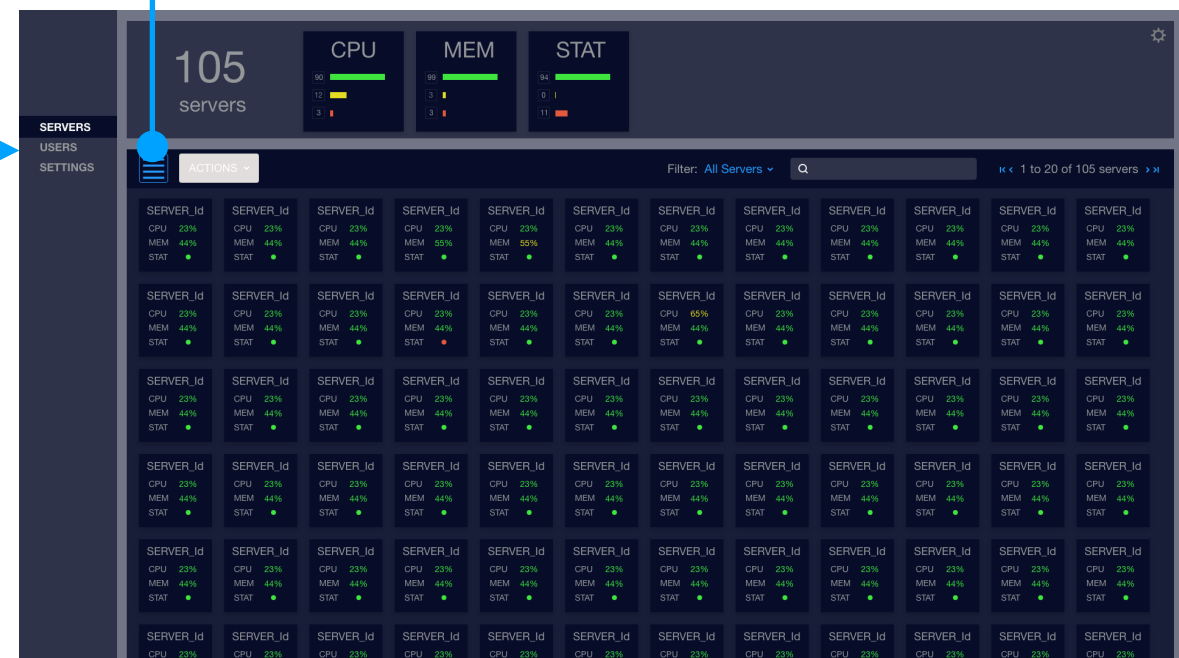

## Listview

Is good at revealing more information about every single server, and also support actions applied to each server

## Gridview

Is good at showing more server status in one page

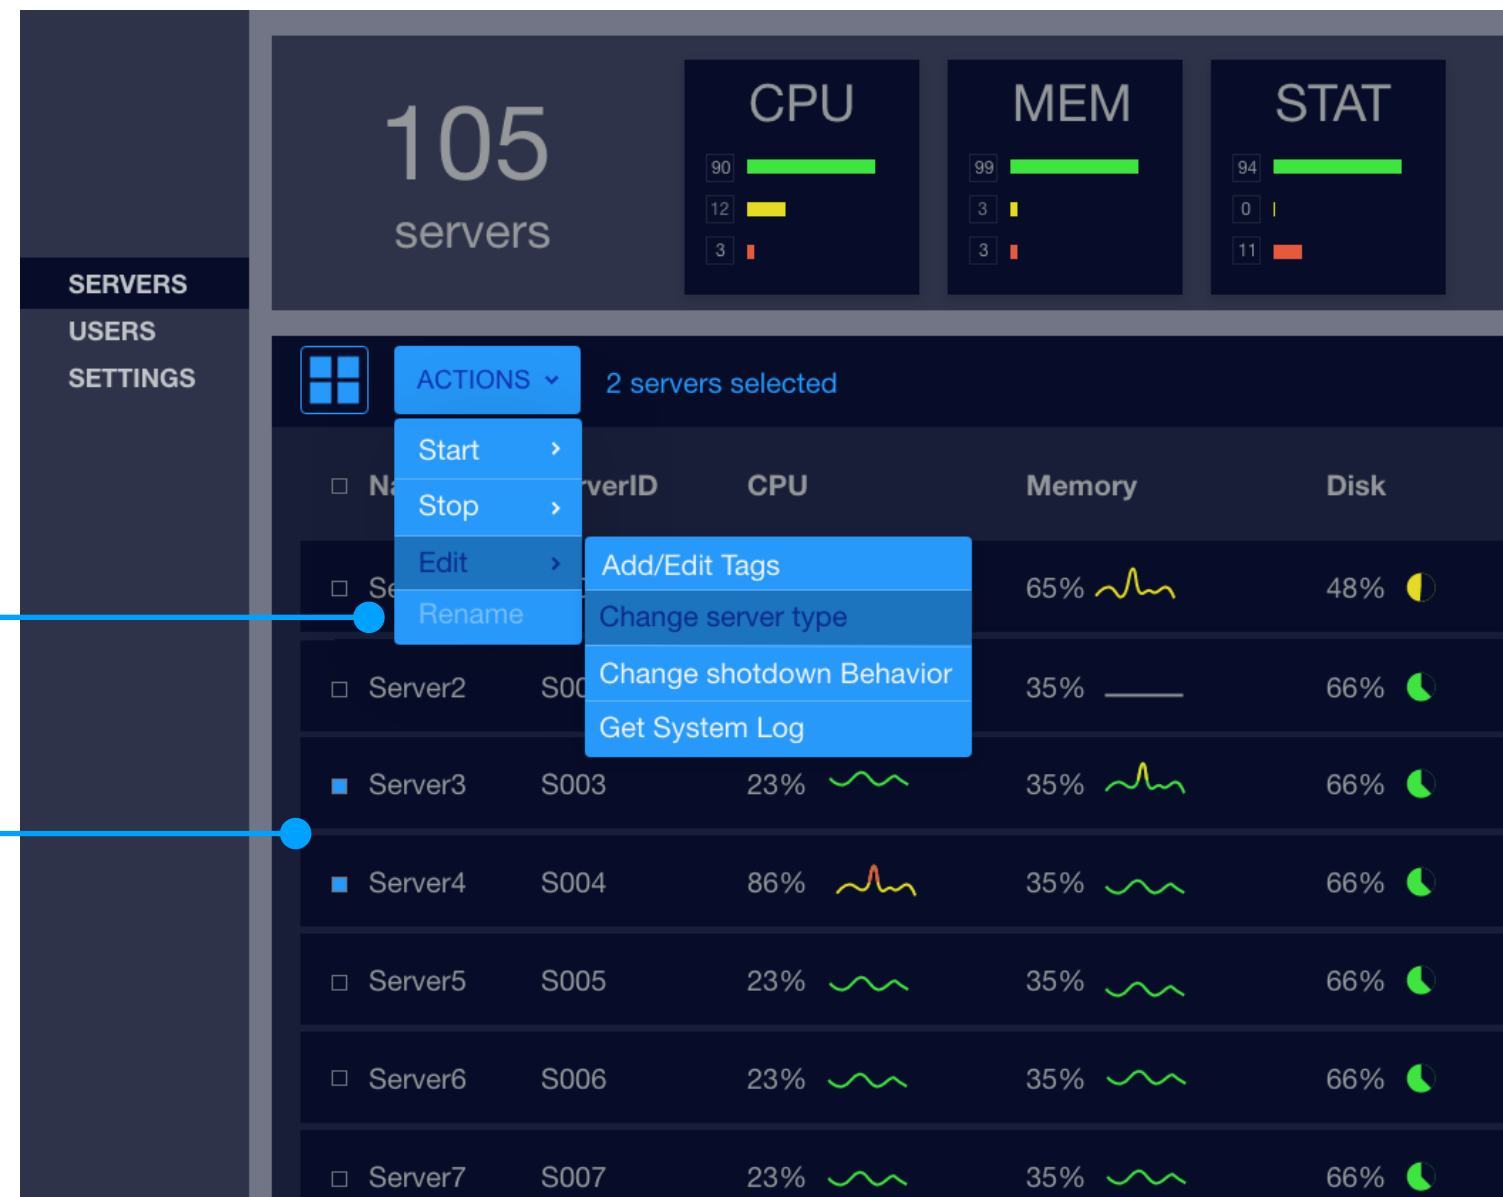

# Support basic actions on the server

System should determine the available operation for single or batch action

## Batch Action

Multiple selection on list items to support batch action

# Highlight any issues with the servers

## Color coded symbol

Different color to indicate system status.

## Historical Snapshot

While realtime data shows current status, data of the past is equally critical to monitor system health

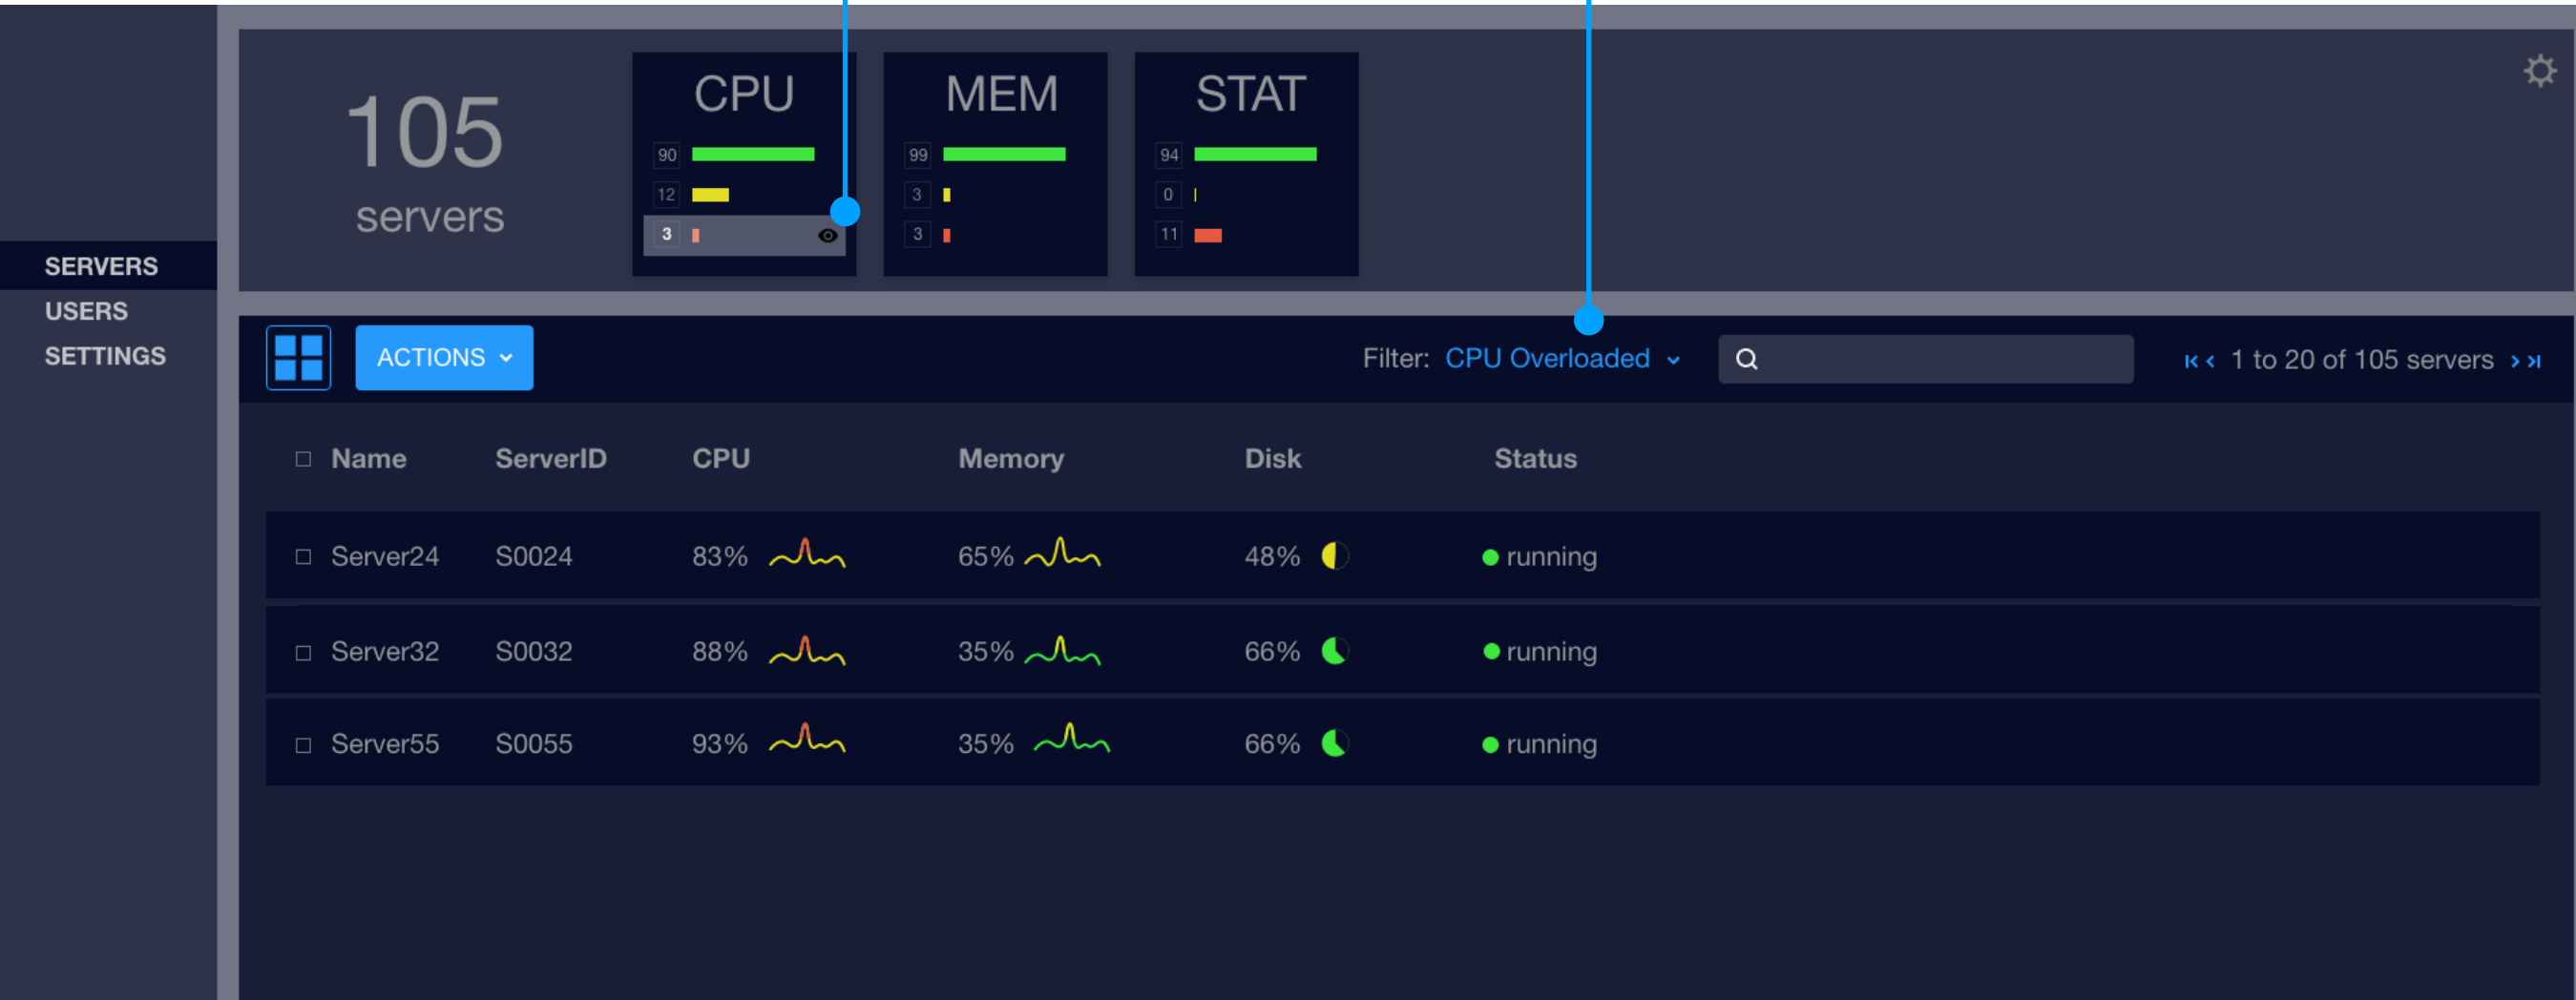

# Highlight any issues with the servers

## Filter

Only show relevant servers based on concerned information

Current filter applied
